

Supplementary Figures

Figure S1 VEGF₁₂₁-fibrin treatment leads to growth of stable blood vessels. Desmin stained mural cells were quantified on immunofluorescence stained frozen tissue sections after one week of treatment of early inflammatory comb lesions (C++; A), of comb ulcers (C+++; B), and neck ulcers (N+++; C). *P* values have been calculated using the Mann-Whitney-U test adjusted by the Kruskal-Wallis test. Each dot represents a single lesion. Horizontal bars indicate median values. Representative false colour overlay pictures of desmin and DAPI stainings (D-F). Original magnification 200x.
